

Alex Gerlitz

Python Backend / QA API Automation | Internal Tools | API/CRM Integrations

I turn messy business workflows into backend-owned slices with tests, logs, docs, and handoff.

Best fit: remote Junior Python Backend, QA Automation Python, API Testing, CRM/API Integration, workflow integration, or Internal Tools roles where the first month can prove one useful workflow slice.

WHY MESSAGE ME
First useful result: one endpoint, data model, admin queue step, API/CRM mapping, API check, or runbook gap shipped as a reviewed slice.
Risk reduced: unclear workflow state, brittle automation glue, unverified AI output, missing logs, and weak handoff.

BEST-FIT ROLES
Where I am strongest now

Junior Python Backend

QA Automation Python / API Testing

CRM/API Integration

Internal Tools / Ops Automation

START HERE
Autoschool Intake/Admin
Telegram intake -> backend validation -> database record -> admin queue -> operator status, shown with synthetic public evidence only.

STACK MATCH
Python backend surface
Python, FastAPI, PostgreSQL, pytest, REST/OpenAPI, SQL checks, Docker Compose, GitHub Actions, runbooks.

SCOPE CLARITY
Not senior DevOps
Docker/CI is delivery support. I am not selling Kubernetes, Terraform, or platform ownership as the headline.

FIRST MONTH
How I prove value
Map: workflow, risky boundary, data shape, owner, and acceptance check. **Ship:** one backend, integration, or QA/API slice. **Handoff:** docs, smoke checks, logs, rollback notes, and next slice.

RESPONSIBLE AI USE
How I use AI

- AI speeds discovery, implementation, debugging, docs, and review.
- Architecture, privacy, verification, logs, docs, and shipped quality stay mine.
- Private production data is never exposed in public proof.

Suggested review path: LinkedIn message -> PDF resume -> First Backend Role Fit -> Autoschool Intake/Admin Proof -> Decision-Ready Contact.

Work Samples To Inspect

SAMPLE	WHAT IT PROVES	OPEN
Autoschool Intake/Admin Proof	First-job backend/internal-tools workflow: Telegram request intake, validated payload, database-style record, admin queue row, operator status, and privacy boundary.	alexgerlitz.github.io/AlexGerlitz/autoschool-intake-admin.html
First Backend Role Fit	Small reviewed backend task shape: endpoint, model, admin workflow step, tests or smoke checks, docs, and handoff.	alexgerlitz.github.io/AlexGerlitz/first-backend-role.html
DriveDesk AI Operator	Backend-owned AI workflow: document/transcript/CRM lead intake, RAG, call-analysis JSON, Telegram approval, audit, retries, and CRM handoff.	alexgerlitz.github.io/AlexGerlitz/drivedesk-ai-operator.html
AI Ops Workflow Kit	FastAPI/PostgreSQL/pgvector proof with privacy redaction, approvals, idempotent outbox, transcript analysis, and dry-run CRM handoff.	github.com/AlexGerlitz/ai-ops-workflow-kit
DriveDesk Core	FastAPI/PostgreSQL backend foundation: tenants, RBAC, audit/outbox, workers, adapter boundaries, OpenAPI, CI, docs.	github.com/AlexGerlitz/drivedesk-core
Verification Pack	Current public proof freshness: GitHub profile route, Pages routes, live smoke checks, pinned proof repos, CI, and proof status.	alexgerlitz.github.io/AlexGerlitz/verification-pack.html

BEST USE CASES

- Python/FastAPI backend workflow slices.
- QA/API verification with pytest, REST/OpenAPI checks, SQL/data checks, and smoke evidence.
- CRM/ERP/API adapters, mappings, retries, audit logs, and data boundaries.
- Internal admin tools and operator workflows.
- AI/RAG workflow only when attached to backend state, approvals, verification, and handoff.

SCOPE CLARITY

- I am not claiming senior production ownership of cloud, Kubernetes, Terraform, or platform architecture.
- I can support Docker Compose, CI, health checks, smoke checks, logs, and runbooks as part of backend delivery.
- The right first test is a bounded reviewed task, not a vague all-in ownership ask.

EXPERIENCE BASIS

Autoschool54 / DriveDesk, March 2024 - Present

Remote Python/backend and application-support work for a live driving-school operation: internal tools, Telegram intake to admin workflows, API/CRM-style handoff, SQL/data checks, documents, schedules, payments, accounts, access, troubleshooting, internal docs, deployment/support notes, and recovery paths. Public proof replaces private data with synthetic evidence.
